

**Amendments to the Claims:**

The following listing of claims will replace all prior versions, and listings, of claims in the application. Please amend the claims as follows:

1. (Currently Amended) A conduit for transferring a flowable material, comprising:  
a wall member at least partially enclosing an inner region, the inner region being adapted to receive the flowable material and to facilitate transfer of the flowable material from a first location to a second location; and  
a plurality of reflective members being at least one of formed within an outer layer of the wall member and disposed on an outer surface of the wall member, the reflective members being disposed in at least one substantially continuous annular band about the wall member and adapted to at least partially reflect light incident thereon.
2. (Original) The conduit of Claim 1, wherein the reflective members include reflective glass beads.
3. (Original) The conduit of Claim 1, wherein the wall member includes a first portion and a second portion, the first portion having a first concentration of reflective members and the second portion having a second concentration of reflective members.
4. (Original) The conduit of Claim 3, wherein the first concentration of reflective members is greater than the second concentration of reflective members.
5. (Currently Amended) The conduit of Claim 3, wherein the second portion of the wall member is adapted to be inserted into a receiving receptacle of an aerial refueling system, and wherein the second portion includes the substantially continuous annular band disposed about a marking on the wall member at a location corresponding to a minimum insertion length

of the second portion into the receiving receptacle for proper operation of the ~~an outer refueling limit of an~~ aerial refueling system.

6. (Currently Amended) The conduit of Claim 3, wherein the second portion of the wall member is adapted to be inserted into a receiving receptacle of an aerial refueling system, and wherein the second portion includes the substantially continuous annular band disposed about a marking on the wall member at a location corresponding to a maximum insertion length of the second portion into the receiving receptacle for proper operation of the ~~an inner refueling limit of an~~ aerial refueling system.

7. (Original) The conduit of Claim 1, wherein the wall member includes a cylindrical wall member.

8. (Original) The conduit of Claim 1, wherein the wall member includes a flexible aerial refueling hose.

9. (Original) The conduit of Claim 1, wherein the wall member includes a refueling boom.

10. (Currently Amended) An apparatus for transferring a flowable material, comprising:

a tank adapted to contain a flowable material;

a conduit operatively coupled to the tank and adapted to receive the flowable material and to facilitate transfer of the flowable material between the tank and a second location, the conduit including a wall member; and

a plurality of reflective members being at least one of formed within an outer layer of the wall member and disposed on an outer surface of the wall member, the reflective members being disposed in at least one substantially continuous annular band about the wall member and adapted to at least partially reflect light incident thereon.

11. (Original) The apparatus of Claim 10, wherein the reflective members include reflective glass beads.

12. (Original) The apparatus of Claim 10, wherein the wall member includes a first portion and a second portion, the first portion having a first concentration of reflective members and the second portion having a second concentration of reflective members.

13. (Original) The apparatus of Claim 12, wherein the first concentration of reflective members is greater than the second concentration of reflective members.

14. (Currently Amended) The apparatus of Claim 12, wherein the apparatus includes an aerial refueling system, wherein the second portion of the wall member is adapted to be inserted into a receiving receptacle of the aerial refueling system, and wherein the second portion includes the substantially continuous annular band disposed about a marking on the wall member at a location corresponding to a minimum insertion length of the second portion into the receiving receptacle for proper operation ~~an outer refueling limit~~ of the aerial refueling system.

15. (Currently Amended) The apparatus of Claim 12, wherein the apparatus includes an aerial refueling system, wherein the second portion of the wall member is adapted to be inserted into a receiving receptacle of the aerial refueling system, and wherein the second portion includes the substantially continuous annular band disposed about a marking on the wall member corresponding to a maximum insertion length of the second portion into the receiving receptacle for proper operation ~~an inner refueling limit~~ of the aerial refueling system.

16. (Original) The apparatus of Claim 10, wherein the conduit includes a cylindrical wall member.

17. (Original) The apparatus of Claim 10, wherein the conduit includes a flexible aerial refueling hose.

18. (Original) The apparatus of Claim 10, wherein the conduit includes a refueling boom.

19. (Original) The apparatus of Claim 10, further comprising a pump operatively coupled to the tank and to the conduit and adapted to pump the flowable material from the tank to the conduit.

20. (Currently Amended) An aircraft, comprising:  
a fuselage;  
a propulsion system operatively coupled to the fuselage; and  
an aerial refueling system coupled to the fuselage and including:  
a tank adapted to contain a flowable material;  
a conduit operatively coupled to the tank and being adapted to receive the flowable material and to facilitate transfer of the flowable material between the tank and a second location, the conduit including a wall member; and  
a plurality of reflective members being at least one of formed within an outer layer of the wall member and disposed on an outer surface of the wall member, the reflective members being disposed in at least one substantially continuous annular band about the wall member and adapted to at least partially reflect light incident thereon.

21. (Original) The aircraft of Claim 20, wherein the reflective members include reflective glass beads.

22. (Original) The aircraft of Claim 20, wherein the wall member includes a first portion and a second portion, the first portion having a first concentration of reflective members and the second portion having a second concentration of reflective members.

23. (Original) The aircraft of Claim 22, wherein the first concentration of reflective members is greater than the second concentration of reflective members.

24. (Currently Amended) The aircraft of Claim 22, wherein the apparatus includes an aerial refueling system, wherein the second portion of the wall member is adapted to be inserted into a receiving receptacle of the aerial refueling system, and wherein the second portion includes the substantially continuous annular band disposed about a marking on the wall member at a location corresponding to a minimum insertion length of the second portion into the receiving receptacle for proper operation ~~an outer refueling limit~~ of the aerial refueling system.

25. (Currently Amended) The aircraft of Claim 22, wherein the apparatus includes an aerial refueling system, wherein the second portion of the wall member is adapted to be inserted into a receiving receptacle of the aerial refueling system, and wherein the second portion includes the substantially continuous annular band disposed about a marking on the wall member at a location corresponding to a maximum insertion length of the second portion into the receiving receptacle for proper operation ~~an inner refueling limit~~ of the aerial refueling system.

26. (Original) The aircraft of Claim 20, wherein the conduit includes a cylindrical wall member.

27. (Original) The aircraft of Claim 20, wherein the conduit includes a flexible aerial refueling hose.

28. (Original) The aircraft of Claim 20, wherein the conduit includes a refueling boom.

29. (Original) The aircraft of Claim 20, further comprising a pump operatively coupled to the tank and to the conduit and adapted to pump the flowable material from the tank to the conduit.

30. (Currently Amended) A method of transferring a flowable material, comprising:  
providing a conduit operatively coupled to a tank containing the flowable material, the conduit being adapted to receive the flowable material and to facilitate transfer of the flowable material between the tank and a second location, the conduit including a wall member having a plurality of reflective members being at least one of formed within an outer layer of the wall member and disposed on an outer surface of the wall member, the reflective members being disposed in at least one substantially continuous annular band about the conduit and;  
illuminating the at least some reflective members with an incident light;  
reflecting the incident light using the at least some reflective members; and  
transferring the flowable material through the conduit from the tank to the second location.

31. (Original) The method of Claim 30, wherein providing a conduit operatively coupled to a tank includes providing a conduit operatively coupled to a refueling tank of a tanker aircraft.

32. (Original) The method of Claim 30, wherein providing a conduit including a wall member having a plurality of reflective members includes providing a conduit including a wall member having a plurality of reflective glass beads.

33. (Currently Amended) The method of Claim 32, wherein providing a conduit including a wall member having a plurality of reflective members includes providing a conduit including a wall member having a first portion and a second portion, the first portion having a first concentration of reflective members and the second portion having a second concentration of reflective members, wherein the second portion of the wall member is adapted to be inserted into a receiving receptacle of an aerial refueling system, and wherein the second portion includes

the substantially continuous annular band disposed about the wall member at a location corresponding to a minimum insertion length of the second portion into the receiving receptacle for proper operation of the aerial refueling system.

34. (Original) The method of Claim 30, wherein transferring the flowable material through the conduit from the tank to the second location includes transferring the flowable material through the conduit from the tank to a receiving aircraft.

35. (Original) The method of Claim 30, wherein transferring the flowable material through the conduit from the tank to the second location includes pumping the flowable material from the tank.
